ID-PRINTER

ID-Printer

Cat-No. 170970

Application

The ID-Printer is an apparatus for labelling all radiographs by photography. It is suited for any film material: screened X-Ray Film Cassettes, no-screen films and X-ray paper.

Connection

The ID-Printer can be connected to a socket.

The ID-Printer is made for 220 V. The apparatus must have a protective grounding.

General

The ID PRINTER window is 15,0 cm x 1,2 cm. In order to facilitate work it is necessary to label the films always at the same point:

The labelled film should show the inscription always either at its upper or at its lower margin. After you have made your decision as to this point, it will be easy for your assistants always to place the film correctly under the respective paper strip with the patient's data. At the point where the labelling is to be made the film must by no means be exposed neither to the screen light nor to the X-rays. At this particular point the photographic labelling of the film will be done after it has been taken out of the pack.

Accessories

Cat.-No.

Paper stripes, with or without imprint, 1.000 sheets / 8.000 pcs
Screen covering tapes, self adhesive, 1 pair
